

BUMBLE-BEEHAVE: Manual

To run the Bumble-BEEHAVE model you need to install the free, open source software NetLogo version 5.3.1: <https://ccl.northwestern.edu/netlogo/5.3.1/>

Bumble-BEEHAVE can be downloaded here: <http://beehave-model.net/>

Make sure the Bumble-BEEHAVE folder is unzipped and all input files are in the same folder as the program. We recommend to also carefully read the ODD protocol for the model.

Overview Interface

1

1.) To run the model, press "SETUP" and "Run" (Or "1 day", "1 week" etc.). "31stDec" runs the model until the end of the year. "run X Days" runs it for "X_Days" (Note: green boxes are input fields). "DEFAULT" sets all input options on the interface (except of "RAND_SEED") to their default value. "VERSION TEST" runs the model under specified conditions to determine whether or not the code was changed (However, some changes might remain undetected). "RAND_SEED" defines the initial value for the pseudo-random number generator and hence the sequence of random numbers created during a model run, i.e. without other changes, the same random-seed creates exactly the same results. If "RAND_SEED" is 0, the seed is automatically set, based on the current date and time. In this case, the results of a run are not replicable and every run (slightly) differs from previous runs.

SETUP & RUN

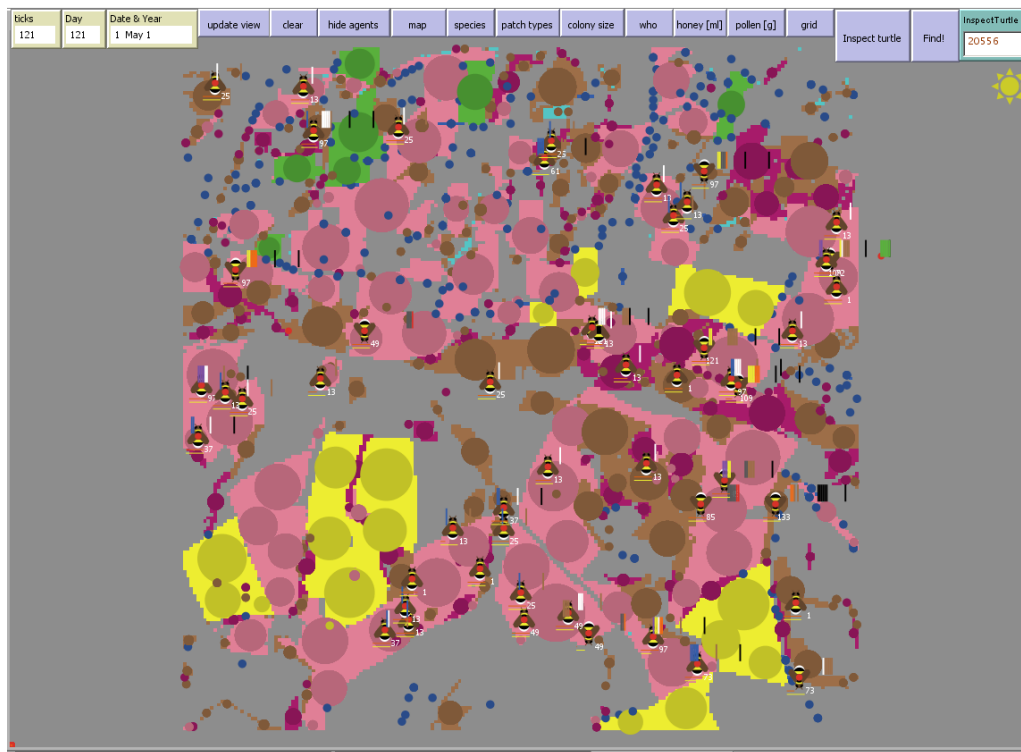

DEFAULT ^D	VERSION TEST	1 day ¹	1 week ⁷	RAND_SEED
	Setup* (no cohorts)	1 month ³	1 year ⁵	1 0: no seed!
SETUP ^S	Run ^R	31st Dec	run X days ^X	X_Days
				90

Use the NetLogo speed slider to increase the running speed of the model:

2

2) The simulated "world" shows locations of food sources and bumblebee colonies as well as colony structures and stores.

Food sources are shown as circles, colonies as bumble bees:

Adult queens are shown as red circles (mother queens on the "thorax" of their colony). Each (vertical) bar represents a cohort of bees, with the size of the bar reflecting the number of bees (in "cohort-based colonies" (see 3) this number is constant (= 12 bees)). Colonies are shown upside down once they reached their competition point and no more eggs can be produced. "Individual-based colonies" are shown with orange wings and head.

The horizontal bars below the colony show the pollen (orange) and nectar (yellow) stores of the colony, relative to the colony's need for nectar and pollen. The number in the bottom right corner (the colony's label) shows the total colony size (including brood) (to show other colony statistics, see 10).

Blue bars are diploid (female) eggs, white bars (female) larvae, brown bars are worker pupae, black bars are adult workers. Purple bars are haploid (male) eggs, yellow bars male larvae, grey bars male pupae and green bars male adults. Orange bars are queen destined larvae, red bars queen pupae (red circles away from a colony are hibernating queens). Diploid male brood follows the same colour schemes as diploid worker brood but diploid adult males are shown in green (if "SexLocus?" is true).

3

3.) Modify the initial number of queens (you have to press "Setup" afterwards to run the model). "N_Psithyrus" refers to (generic) cuckoo bees which can infest the colonies of any bumblebee species. "N_Badgers" defines the number of badger setts. Colonies in the vicinity of a badger sett might be destroyed. If not enough habitat for badgers are available, the actual number of setts created (shown on the yellow monitor "N badgers") might be lower than the input value of "N_Badgers". "Colonies_IBM" defines the number of colonies created as fully individual based (as

opposed to "cohort-based colonies" where each cohort of bees is represented by only one bee agent in the model).

Initial Queens & Badgers

B_terrestris 500	B_hortorum 0	Note: changing these numbers during a run results in an error message!
B_lapidarius 0	B_pratorum 0	
B_pascuorum 0	B_hypnorum 0	
Colonies_IBM 0		N_Psithyrus 0
all 100		N_Badgers 0 suggested: 0-3/km2
all 0		N badgers 0
Plots: show nothing		

Representations of colonies of the different bumblebee species (top left to bottom right: B. hypnorum, B. pratorum, B. terrestris, B. hortorum, B. pascuorum and B. lapidarius):

Colonies infested by a Psithyrus queen are surrounded by a circle:

Representation of a badger sett:

4

4.) "InputMap" is an image file showing the map of the model area. It serves only to inform the user but is not used by the model itself. "ChooseInputMap" and pressing "Apply" is a quick way to set "InputMap", given that the file name is already defined (right mouse click on "ChooseInputMap" and "Edit" allows the user to add/delete options). "TotalMapArea_km2" is the area [km²] of the loaded map and is used to calculate the nest density per km² ("ColonyDensity_km2"). "Input_File" specifies the the text file that defines the food sources in the landscape (their location, the amount of nectar and pollen they provide etc.). "MapAreaIncluded" is a quick way to restrict the simulation to only a half or a quarter of the total area, which speeds up model runs. "FlowerspeciesFile" defines the characteristics of forage plant species, "SpeciesFilename" defines the input files that contains parameterisation for the bumblebee species. "Weather" defines the maximal time the bees are allowed to forage on each day.

Input Files, Map & Weather

InputMap	TotalMapArea_km2
BBH-I_Suss1.png	25 (only used to calculated nest density)
Apply!	ChooseInputMap BBH-I_Suss1.png ▼
Input_File	MapAreaIncluded
BBH-T_Suss1.txt	complete ▼
Apply!	ChooseInputFile BBH-T_Suss1.txt ▼
FlowerspeciesFile BBH-Flowerspecies_Suss.csv ▼	
SpeciesFilename BBH-BumbleSpecies_UK_01.csv ▼	
Weather Constant 8 hrs ▼	

Left: Landscape as defined by "InputMap" only. Right: Same landscape represented by food sources, defined in "Input_File". The map on the left only serves to inform the user, the model itself is solely based the location and size of defined food sources (right map).

The weather symbols illustrate today's foraging conditions, with the maximal hours of foraging shown at the bottom right of the symbol:

5

5.) A number of plots visualise the results of the simulation run. Click on the red triangle to change the output shown on each of the "generic" plots.

6

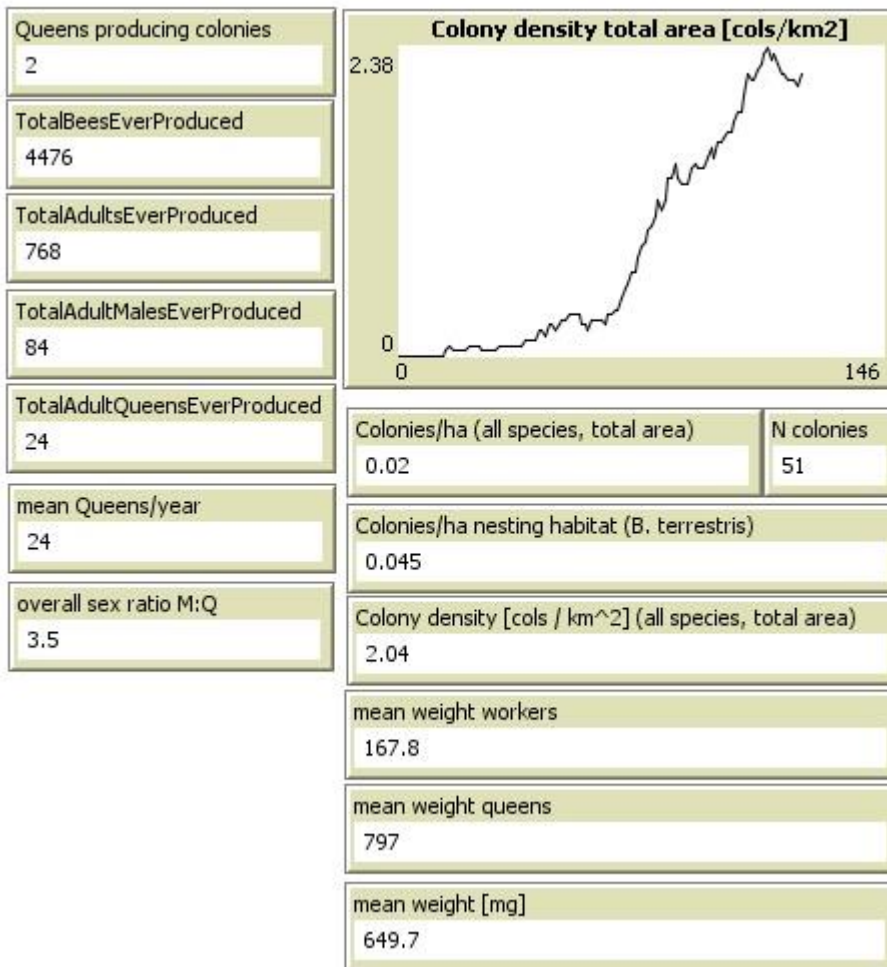

6.) Some results are also shown on the "Output" window, e.g. characteristic dates of colony development (time step of emergence of first worker, switch point (SP), competition point (CP), queen production, death of colony) and the number of queens and males produced whenever a colony dies.

Colony statistics

```
One or more very small food sources removed! To avoid, set RemoveEmptyFoodSources? 'false'!

7

7.) More information is provided by monitors and (non generic) plots.

Right mouse click & "Edit" to show under "Reporter" how the value is calculated. For the calculation, of a global variable, go to the code and search for "set VARIABLENAME"

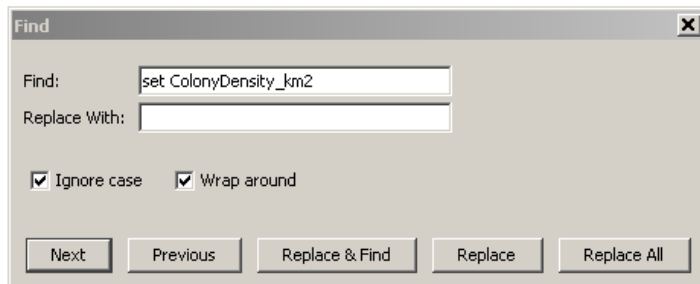

For example: calculation of "Colony density [cols / km²] (all species, total area)":

```

to OutputDailyProc
with-local-randomness ; allows changing/switching off plots without
[
  random-seed ticks ; local random seed, only valid within this pr
  set TotalIBMColonies count colonies with [ cohortBased? = false
  set TotalQueens sum [ number ] of bees with [ caste = "queen"
  set TotalMatedQueens sum [ number ] of bees with [ caste = "queen"
  set TotalUnmatedQueens sum [ number ] of bees with [ caste = "queen"
  set TotalHibernatingQueens sum [ number ] of bees with [ activity = "hibernating"
  set TotalColonies count colonies

MasterSizeFactor 1.0			

9

9. Display options on "world"

"Pollen visits", "Nectar visits": displays the number of pollen/nectar visits at each food source (white refers to a high number, black to a low number of visits)

"Reproduction": Highlights grid cells where at least one colony had produced reproductives in the past. Yellow grid cells: males had been produced, red: queens had been produced, green: males and queens had been produced

"Males producers", "Queens Producers": displays food source where either males (green) or queens (red) had been produced in the past.

10

10.)

Choose which agents are shown on the "world" by clicking the switches or pressing the buttons on bottom or top of the world:

"update view": refreshes the view

"clear": removes labels, grid and the image map

"hide agents": hides all bees, food sources etc.

"map": shows or hides the image map

"species" shows the species names of colonies

"patch types": shows the habitat types of food sources

"colony size": shows the colony sizes

"who" shows the ID of colonies

"honey [ml]": shows the nectar store [ml] of the colonies

"pollen [g]": shows the pollen store [g] of the colonies

"grid" shows the grid (the grid size defined by "Gridsize" [m])

"Inspect turtle" opens a NetLogo agent monitor for the agent defined in "InspectTurtle"
 "Find!" shows the location of the agent, defined in "InspectTurtle"

BEESCOUT 2.0

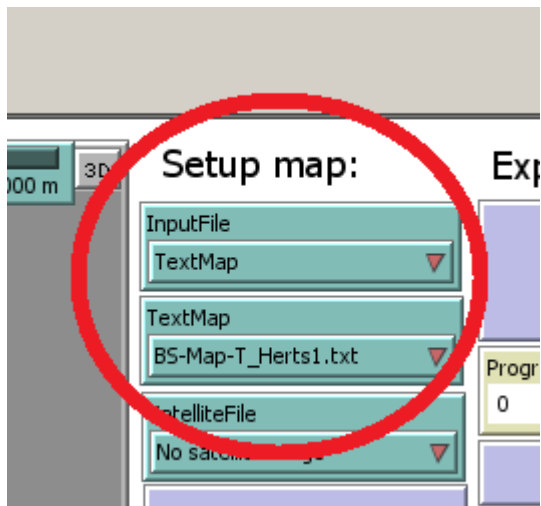

Creating Bumble-BEEHAVE input files with BEESCOUT

To create input files for Bumble-BEEHAVE, defining the available food sources, we updated the BEEHAVE landscape module BEESCOUT. The following instructions refer to the updated version BEESCOUT 2.0

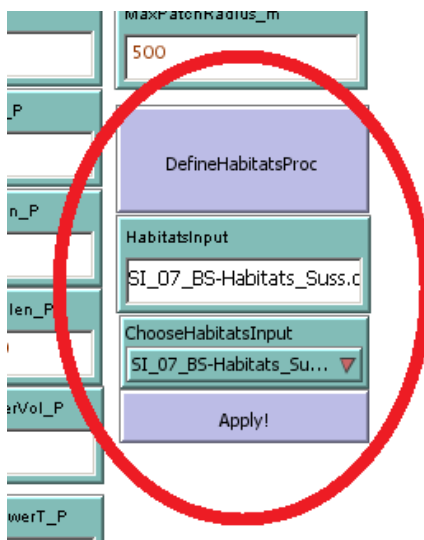

BEESCOU 2.0 can distinguish more habitat colours (nine instead of four) and it allows to have multiple flower species in each habitat type. The flower species present in a habitat type and their density is defined in the input file, specified by "HabitatsInput" (BEESCOU 2.0; user interface: section "Definition food patches" (bottom right))

[illegible]

Format of input file "Habitatinput":

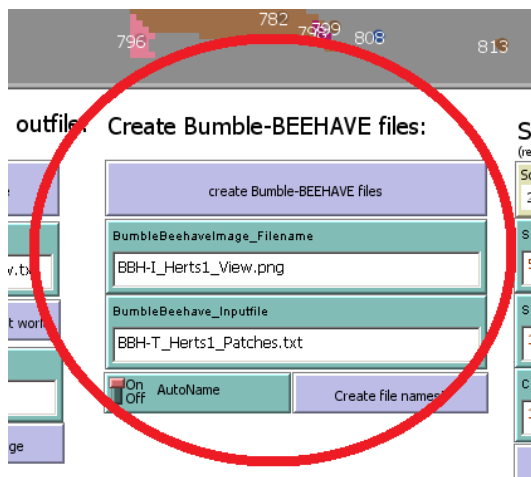

2.) provide a "HabitatsInput" csv-file and insert the file name to the input field

3.) press "Setup" button

4.) provide the names of the files, created as input for Bumble-BEEHAVE (or press the "Create file names" button for a suggestion). Then press "create Bumble-BEEHAVE files" button

Two files (an image (.png) and a text (.txt) file) are created and can be used as input for Bumble-BEEHAVE.

Bumble-BEEHAVE input options (interface)

List of all input options on the interface

VARIABLENAME	Input option	DESCRIPTION
AbundanceBoost	input	factor to increase (or decrease) the amount of nectar and pollen at each food source
B_hortorum	input	number of initial Bombus hortorum queens
B_hypnorum	input	number of initial Bombus hypnorum queens
B_lapidarius	input	number of initial Bombus lapidarius queens
B_pascuorum	input	number of initial Bombus pascuorum queens
B_pratorum	input	number of initial Bombus pratorum queens
B_terrestris	input	number of initial Bombus terrestris queens
Backgroundcolour	input	colour of the 'matrix' (non-patch area) on the map
ChooseInputFile	chooser	a quick way to select a predefined filename as input for "INPUT_FILE" (when pressing "Apply!" button)
ChooseInputMap	chooser	a quick way to select a predefined filename as input for "InputMap" (when pressing "Apply!" button)
Colonies_IBM	input	(maximal) number of colonies implemented as individual-based
FlowerspeciesFile	chooser	input file with the specifications of flower species
FoodSourceLimit	input	approx. number of trips a food source must be able to supply with nectar or pollen, otherwise, foodsource might be removed
ForagingMortalityFactor	input	is multiplied by MORTALITY_FORAGER_PER_SEC to modify the foraging mortality

ForagingMortalityModel	chooser	to set MortalityForager_per_s; 3 options: (1.) "high" (1.0E-05): Visscher&Dukas 1997 (Mortality: 0.036 per hour foraging, honeybees) (2.) "intermediate" (2.14E-06): Schmid-Hempel & Heeb 1991: mortality 30-40% per week (\Rightarrow 35%), survival rate per week: 0.65, assuming 8hrs foraging per day: $7 * 8 * 3600 = 201600$ seconds, survival rate/s = $0.65^{(1/201600)} \Rightarrow$ mortality rate/s 2.14E-06 (3.) "low" (2.75E-07): Stelzer et al. 2010 (doi:10.1111/j.1469-7998.2010.00709.x), Tab. 1 (from mean of loss rate %/h)
GenericPlot1	chooser	defines the graphs shown on associated plot
GenericPlot2	chooser	defines the graphs shown on associated plot
GenericPlot3	chooser	defines the graphs shown on associated plot
GenericPlot4	chooser	defines the graphs shown on associated plot
GenericPlot5	chooser	defines the graphs shown on associated plot
Gridsize	slider	distance [m] of gridlines, which can be shown on the map
Input_File	input	name of the text file read in to define number and specifications of foodsources
InputMap	input	name of the image file read in to define the map, (supported formats: BMP, JPG, GIF, and PNG)
InspectTurtle	input	ID (who) of a turtle that can be addressed by the buttons "Inspect turtle" or Find!"
KeepDeadColonies?	switch	If false, dead colonies are removed after each year
Lambda_detectProb	input	to calculate the the probability that a worker of a certain colony finds a certain foodsource, based on the distance [m] between foodsource and colony (detection probability is then $e^{-(\text{Lambda_detectProb} * \text{relevantDistance_m})}$). Use the BEESCOUT model to simulate detection probabilities and derive lambda.
MapAreaIncluded	chooser	either the "complete" map area is included in the simulation or only one quarter, defined by the user
MasterSizeFactor	input	affects the size of elements (turtles) displayed on the map
MaxHibernatingQueens	input	maximal number of hibernating queens in the simulation. If exceeded, queens (irrespective of species) are randomly picked and removed
MinSizeFoodSources?	switch	If true foodsources offering less nectar or pollen as it is required for ca. than ca. "FoodSourceLimit" foraging trips have their nectar or pollen set to 0.

N_Badgers	input	number of badgers (badger's setts) in the simulation; suggestions for initial number of badgers: zero, intermediate (>0–3 setts km ²) and high (>3 setts km ²); Reilly & Courtenay 2007 (Preventive Veterinary Medicine 80: 129–142)
N_Psithyrus	input	initial number of cuckoo bees
RAND_SEED	input	if <> 0: initial seed for the Netlogo pseudo-random number generator; if set to 0, random-seed is not set
RemoveEmptyFoodSources?	switch	if true, foodsources that don't provide neither nectar nor pollen (e.g. because MinSizeFoodSources? is true) are removed during Setup
SexLocus?	switch	if true, homozygous diploid eggs will develop into males instead of workers or queens (diploid males can survive into adulthood and even mate but cannot reproduce)
ShowCohorts?	switch	if true, bee cohorts are shown on the map
ShowDeadCols?	switch	if true, dead colonies are shown on the map
ShowFoodsources?	switch	if true, foodsources are shown on the map
ShowGrid?	switch	if true, a grid is shown on the map
ShowInspectedColony?	switch	if true, certain "plotChoices" (e.g. "Colony structures") show the output of a single colony, defines by "inspectTurtle". If false, an average value of all colonies is calculated and shown in these plots
ShowMasterpatchesOnly?	switch	if true, non-masterpatches are hidden from the map
ShowNests?	switch	if true, colonies are shown on the map in the shape of a bumblebee of the respective species
ShowPlots?	switch	if true, "GenericPlots" are updated each time step
ShowQueens?	switch	if true, mated queens are shown on the map in the shape of a red circle
ShowSearchingQueens?	switch	if true, not-hibernating queens without a colony are shown on the map (in the very bottem left corner)
ShowWeather?	switch	if true, the weather symbols (sun/cloud) and the hours of foraging for the current day are shown
SpeciesFilename	chooser	name of the input file that provides parameter values of the bumblebee species
UnlimitedMales?	switch	if true, queens are allowed to mate, even if no males are currently present in the simulation

Weather	chooser	defines the weather conditions as hours of foraging allowed on each day of the simulation
WinterMortality?	switch	if true, hibernating queens can die due to winter mortality in the procedure "EmergenceNewQueensProc"
X_Days	input	defines how many time steps the model proceeds, when the button "run X days" is pressed
